

Here we demonstrate how to start your internet browser and how to get the best from browsing your page content.

From your desktop, open an internet browser. For Microsoft Windows environments, Internet Explorer can usually be selected from the Start menu, then All Programs, and Internet Explorer.

If you do not have access to Microsoft Internet Explorer, we recommend using the Mozilla Firefox browser instead (available for Windows, Linux and Mac).

Remember to "maximise" your browser window to get the best effect when exploring page content.

Scrollbars are sometimes shown along the bottom or down the side of the page to help you explore page content which is too big to fit in the window.

You can move directly to the top of a web page by using CTRL+Home or CTRL+Page Up.

You can move directly to the bottom of a web page by using CTRL+End or CTRL+Page Down.

Move the mouse pointer around to explore the page content.

Additional information is sometimes shown when you position the mouse over icons.

As you position the mouse over a hyperlink, you should notice the mouse pointer changes to the "Hyperlink Hand", and that the hyperlink is underlined.

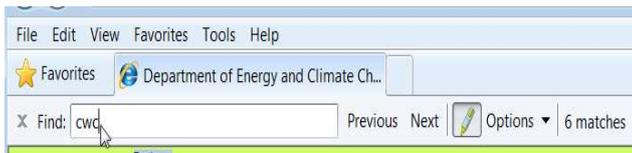

You will also notice the mouse pointer changes to a "Hyperlink Hand" when it is positioned over a clickable icon.

The "Hyperlink Hand" pointer usually indicates the mouse is positioned over something that is clickable.

Hyperlinks and clickable icons let you navigate around and interact with the page content.

To activate a hyperlink or clickable icon, make sure the mouse is positioned so the "Hyperlink Hand" is shown and "Select" with the mouse (usually a single click with your left mouse button).

Use the web browser's Find function – CTRL+F or your browser's edit menu - to search the entire web page.
